

Build internal AI apps on internal data.

A governed application factory for domain teams: describe what you need, bind only approved data and tools, deploy onto organization-controlled compute, and keep durable AI capabilities inside the finished app.

Lovable-like creation

+ enterprise data, identity, policy and operations

FROM INTENT TO AN AUTHENTICATED INTERNAL URL

1 Describe

Intent, users, outcomes and success criteria.

2 Bind

Approved data, tools, models and deployment target.

3 Build

Durable session, tests, preview and trusted OCI evidence.

4 Govern + deploy

Review access, policy, desired state and lifecycle.

5 Run with native AI

Durable agents, retrieval, reports, schedules and approvals.

Why this is different

- **Data stays where it belongs**
Attach in place, clone deliberately, or provision app-owned state.
- **Your compute, models and policies**
Local Kubernetes, private cloud or an approved enterprise environment.
- **AI is native to the application**
Build-time, application-time and operations-time agents share one durable runtime.
- **Governed by desired state**
Policy, PR review, GitOps, audit, rollback and ownership-safe teardown.

One platform. Clear boundaries.

- **OpenGeni** Durable build and app-agent sessions, tools, goals, approvals, schedules, events and compute.
- **CloudGeni** Targets, desired state, infrastructure validation, policy, PR delivery, drift and lifecycle governance.
- **Your environment** Application containers, identity, data, secrets, ingress, observability, backup and network controls.

Hard boundary: agents build, test and operate the app; a durable workload serves it. A sandbox is never the production hosting plane.

REFERENCE EXPERIENCE

"Create a materials explorer using the approved measurements database read-only; store derived annotations in an isolated database; let researchers ask questions, compare experiments and generate reports; expire the demo after seven days."
