

# Internal AI apps without per-app infrastructure.

Generate a static SPA, review its exact AI and integration capabilities, and publish it to a stable authenticated URL. OpenGeni supplies durable AI, approved internal data and platform-owned approvals through one shared gateway.

Like Lovable for internal teams  
plus native AI + governed internal data

## DEFAULT

### Native OpenGeni Sites

Static SPAs, immutable releases, shared runtime gateway. No app backend or compute target.

## WHEN NEEDED

### Advanced Deployments

Arbitrary full-stack workloads on customer cloud/Kubernetes through governed plans and providers.

#### THE SITE HAPPY PATH

#### 1 Describe + build

Ordinary durable authoring session, files, steering and tests.

#### 2 Preview

Exact HTML in an isolated opaque-origin artifact frame.

#### 3 Review

Models, instructions, tools, integrations, approvals and budget.

#### 4 Publish

Immutable artifact + manifest digest at one stable workspace URL.

#### 5 Run

Durable AI, SSE, approved data, usage, rollback and archive.

### How native AI connects

Typed MessageChannel only - no API key, cookie, generic fetch or credential enters the Site.

### Where data lives

- Site HTML - OpenGeni object storage, hash-bound
- Releases + sessions - OpenGeni Postgres with FORCE RLS
- Source data - Existing system or local knowledge
- Credentials - Encrypted server-side broker only
- Model path - Configured local or declared route

### Governed by every release

- Immutable capability manifest - No silent permission widening.
- Current user authority - Rechecked at runtime admission.
- Platform approvals - Generated HTML cannot fake a write prompt.
- Usage + budget - Attributed to exact Site and release.
- Rollback + archive - No infrastructure mutation required.

#### SINTEF REFERENCE

Host the Site, OpenGeni, approved knowledge/MCP adapter and inference route locally. Demonstrate AI, update and rollback without a Kubernetes workload; enable Advanced Deployments separately only for a real backend need.
